MONEL METAL

Introductory

IT is truly said that industry never creates a demand that the engineer or metallurgist does not meet.

Copper and bronze alloys served most purposes satisfactorily so long as they were only required to withstand alkaline or acid solutions. With the growth of industry new conditions have arisen which call for metals possessing unusual qualities. There is a broad field for an alloy which will withstand acids, high temperatures and the erosive action of hot gases and superheated steam. Monel Metal, highly non-corrodible and with the strength of steel, meets these severe requirements. Monel Metal was first made ten years ago, and the demand for it has grown as rapidly as the knowledge of its characteristics could be spread.

In the early stages of development, Monel Metal was supplied only for its high tensile strength and relative immunity to corrosion, while at the present time Monel Metal has many diversified uses.

It is the endeavor of The Bayonne Casting Company in issuing this pamphlet to direct attention to the physical properties of Monel Metal, the forms in which it is sold and its general uses. It is our further purpose to co-operate in every way with the users of Monel Metal in order to insure its satisfactory application and service. Some of the methods of treatment are not very generally understood and it is our desire that any consumer wishing technical advice or information will communicate with us.

MONEL METAL

Physical Characteristics

MONEL METAL is not a synthetic alloy, but is a natural combination of nickel and copper which is refined without changing the relation of the important elements, *i. e.* Nickel and Copper. These important elements bear the same relation to each other when the alloy is refined and fabricated as when taken from the mines. The smelting and refining merely remove the undesirable elements. Monel Metal contains approximately 67% Nickel, 28% Copper, and 5% other metals.

The ore is mined and smelted in Ontario by The International Nickel Company, who are the sole producers and refiners of Monel Metal. The metal in the form of matte is shipped to the Orford Works of The International Nickel Company, at Bayonne, New Jersey, where it is refined and distributed for fabrication in the form of rods, castings, forgings, tubes, wire, strip stock, sheets, etc. Some idea of the varied uses for which Monel Metal has proved superior may be obtained by referring to pages 44 and 45. In nearly every instance where Monel Metal has been adopted it has replaced some other metal that would not meet the requirements.

Monel Metal can hardly be distinguished from pure Nickel in color; in tensile properties it closely resembles steel, as can be seen by referring to the table of physical properties and tensile tests on pages 8 and 9; it is tough and ductile and can be machined, forged, soldered, brazed and welded by the electric or oxy-acetylene method.

It lends itself admirably to casting and many very intricate patterns have been cast successfully. In its cast form it has the great advantage of unusually high tensile strength. In rod form its tensile strength is also high, and it may be worked with equal facility either hot or cold.

In addition to its resistance to corrosive conditions, Monel Metal also resists oxidation, due to its high nickel content, since nickel possesses in a high degree the property of withstanding the oxidizing influence of hot gases.

MONEL METAL

Influence of Increased Temperatures on the Strength of Monel Metal as Compared with Certain Other Metals and Alloys

THE strength of various metals and alloys at ordinary temperatures is well known and the selection of the proper size piece of a suitable material is comparatively easy. Little is known, however, of the strength of these materials at higher temperatures and it is only by extended investigation of pieces tested at these temperatures that a safe basis for selection may be obtained.

Through the courtesy of the "Valve World" we are able to present the results of an extended investigation by Messrs. Bregowsky and Spring of the Crane Company, Chicago. These tables show both the tensile and torsional strengths of Monel Metal at varying temperatures. We are unable to cover this subject completely in the present limited space and will be very glad to furnish further details and tests to those who are interested, including the results of a set of tests made in the Physical Laboratory of the International Nickel Company. We have also prepared a list of the more important journal references. This is at the disposal of those who wish to inquire for it.

The following tables give comparisons with most of the metals in ordinary use, and reference to them shows that Monel Metal is superior to the majority in this respect both where its tensile and torsional strength at high temperatures are concerned. It is naturally greatly superior to the usual anti-acid metals such as copper and bronze alloys, all of which have low melting points.

Some idea of its ability in this respect may be had from a few typical comparisons. For example, at 70° F., the tensile strength of 30% rolled nickel steel is 94,498 lbs.; that of rolled Monel 104,900 lbs.; at 1030° F., nickel steel shows but 36,350 lbs., Monel Metal 47,200 lbs. Where torsional strength is concerned, 35% nickel steel shows but 25,350 lbs. at 800° F., while the torsional strength of Monel Metal at the same temperature is 40,610 lbs., other comparisons being even more favorable, viz.: 3½% nickel vanadium steel at 800° F., 14,340 lbs.; open hearth machinery steel 26,530 lbs.

Turbine Wheels cast in Monel Metal

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal Castings

THE development in the casting of Monel Metal has covered a period of over eight years. In this time castings have been produced ranging in weight from a few ounces to 25,000 pounds each. The types and applications of these castings are too numerous and too varied to be covered in this booklet. Due to the fact that equal advantages are unobtainable with any other metal, Monel Metal castings have become an absolute necessity in the development and progress of many of the world's industries.

The present plant of The Bayonne Casting Company is equipped to produce Monel Metal castings of any size up to 25,000 pounds in weight in one piece. Owing to our specializing in the production of Monel Metal castings for the past eight years, we have been able to perfect our organization and develop our plant and methods to a high degree of efficiency.

During this period of development we have succeeded in producing a wide range of castings from patterns varying from very simple to the more intricate examples. We are accordingly in a position to produce good castings in Monel Metal to meet an extensive range of requirements, or we will be glad to place our data and experience in casting Monel Metal at the disposal of our customers in order that they may make their own castings. We will also be glad to supply data showing the many applications for which Monel Metal castings have proved to be the only thing that would meet the requirements satisfactorily.

Monel Metal castings have been shipped to all parts of the United States and to England, Italy, Japan and other foreign countries, largely for governmental use. One hundred thousand Monel Metal castings were used for transmission supports in connection with the construction of the Panama Canal. On the opposite page are shown a few of the many types of castings which have been produced in our foundry. The larger water wheel casting is one of seven produced for the Georgia Railway & Power Company's hydro-electric plant. These castings weigh 3,000 pounds each and the wheels run at high speed under a head of 600 feet, each unit producing 18,000 horsepower at 5,014 r.p.m.

THE BAYONNE CASTING CO.

MONEL METAL

Set of Pump Cylinders cast of Monel Metal

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal was specified for this to replace bronze after repeated failures by this material, the trouble experienced with bronze being pitting on the backs of the blades, due to the combined effects of corrosive gases and evacuation resulting from the high speed at which these wheels revolve.

On page 16 is illustrated a set of pump cylinders, cast of Monel Metal for 10'', 16'', and 18'' pumps, furnished by us, which have been in use for nine years in the plant of The International Nickel Company. These pumps handle salt water from the Kill-von-Kull, which is highly polluted by sewage and chemical waste, acids, etc., from the various manufacturing plants adjacent to it. After several years of service these pumps show no signs of deterioration.

As a typical example of the numerous instances in which Monel Metal has proved its superiority in a field unthought of in earlier years, its successful displacement of bronze in the refining of petroleum may be cited. The bronze plugs employed in the Burton gasoline stills had an effective life of but six weeks to a few months. After a year the first Monel Metal plugs furnished to the Standard Oil Company were still in service, and showed no sign of deterioration, so that at the present time their effective life cannot be determined. As a result, these stills in all parts of the country have been furnished with over 80,000 Monel Metal plugs.

In view of the fact that castings vary greatly in difficulty of moulding it is not possible to quote a fixed figure. Prices will be made on receipt of patterns or detailed blue prints.

MONEL METAL

Monel Metal for the Modern Power Plant

Monel Metal Trimmed Valves

FOR the high duty service demanded by super-heated steam, valves having a body of cast steel are required. Monel Metal has a great advantage in this connection in that its coefficient of expansion is nearly the same as cast steel. The result of this fact is that Monel Metal seats, discs, etc., expand and contract with the steel at about the same rate, suffering no changes of size or shape with repeated heating and cooling. Brass and bronze seats expand at a greater rate and become loose and distorted after the valve has been heated and cooled a few times.

The resistance which Nickel offers to the eroding and corroding effects of hot steam is well known. Monel Metal also possesses this property by virtue of its high Nickel content. The tensile strength of Monel Metal castings averages 70,000 pounds, while rolled Monel Metal shows an average tensile strength of 88,000 pounds, with a yield point of 54,000 pounds. Consequently it has a very substantial margin of safety over all ordinary demands for valve work.

Not only does Monel Metal possess these high strengths at ordinary temperatures, but it retains them in a large degree at the temperature employed in superheated steam work. Thus, according to results published in the *Valve World* of January, 1913, cast Monel Metal at 600° F., compared with the same metal at 70° F., retains—

73% of its elastic limit

75% of its tensile strength

while rolled Monel Metal retains—

74% of its elastic limit

85% of its tensile strength

Under torsional test at the same temperatures, hot rolled Monel Metal rods retain 69% of their torsional elastic limit and 76% of their torsional strength.

In the illustration of a section of a Chapman gate valve, the seat, gates or discs and the spindle seat are of cast Monel Metal, while the spindle itself is of rolled Monel

MONEL METAL

Metal. The Chapman Valve Manufacturing Company states in this connection:

"Monel Metal is non-corrodible and is ideal for valves working at high temperatures."

Writing us further on this subject they state:

"We recommend steel valves with complete Monel Metal trimmings which consist of spindles, seat rings and male and female gates, as shown by our list 65½ Superheated Steam Steel Valves, in our catalogue No. 32, pages 141 to 149 inclusive. This is our best valve and is used on any pressure up to 600 pounds working steam pressure, under a total heat of 800° F.

Wherever we have put in the steel valves with Monel trimmings, we have experienced practically no trouble whatever and repeat orders for additional units is some evidence of actual worth.

Yours very truly,

THE CHAPMAN VALVE MANUFACTURING CO.,

(Signed) E. O. DAVIS,

Assistant Manager."

The experience of the Edward Valve and Mfg. Co., has been equally favorable, as shown by their letter:

"We have found that Monel Metal has no equal as a metal to withstand the action of high temperature and superheated steam. All of our high temperature and superheated steam valves have the seat, disc and stem of Monel Metal, and in our non-return valves the dashpot, seat, disc and stem are of Monel Metal.

At the present moment we are building a complete set of steel valves in all sizes up to 6 inches, which will be used in a new power station where the steam pressure will be 350 pounds to the square inch, and the total temperature approximately 680° F. In these valves we have supplied Monel Metal for all the trimmings.

Yours very truly,

THE EDWARD VALVE & MFG. CO.,

(Signed) E. C. HITZE,

Manager Chicago Office."

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal in Turbines

THE use of any material for turbines depends upon four unrelated or only partially related qualities and the selection of the material for use under any certain set of conditions depends largely upon the relative weights that are given to these qualities. These properties are:

1. Ease with which the material can be produced in the required shape.
2. Strength at elevated temperatures.
3. Resistance to the erosive action of steam.
4. Resistance to corrosion.

Based on these qualities, materials for turbine blading have generally been taken from three classes of materials, brass, Monel Metal and nickel steel. Each of these materials to some extent, fulfills the four requirements just enumerated. Each naturally falls short of the perfection desired. Brass can be worked into the forms desired with comparative ease and economy. It is non-corrodible and resists the action of steam to some extent, but its strength is far from that necessary for the large, high speed machines now being built. Nickel steel is the antithesis of brass in these respects. Where strength is the one property demanded, it is most suitable but it does not possess that resistance to corrosion and erosion that is so desirable in all apparatus for handling steam.

Monel Metal occupies a middle ground in its properties between these two. It can be worked into all the necessary forms, while its resistance to the action of steam is remarkable. The turbine can be shut down without corrosion of the blades, and its strength, while not as great as that of heat treated nickel steel, is far superior to that of turbine brass.

Furthermore, as shown by tables in another part of this pamphlet, it retains this strength at elevated temperatures to a remarkable degree. In view of these properties, the rapid development of Monel Metal for turbine parts, chiefly for blading, is only what would be logically expected and we recommend it unqualifiedly for this purpose. Practically all naval vessels, many merchant ships, and quite a few industrial plants completed in the last few years have turbines fitted with Monel Metal blading. The consumption for this purpose during the past year exceeded 1,500,000 lbs.

MONEL METAL

Circulating and Air Pumps, Monel Metal Trimmed,
International Pump Co., Blake & Knowles Works

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal for Pumps

MONEL METAL where used for pump liners, rods, valves, etc., has proved its superiority over all other metals for this purpose due to its extreme toughness and resistance to abrasion and corrosion. This material has gradually become pre-eminent in this line. Monel Metal pump rods for ordinary pumping service will outlast the best grades of bronze several times over. In service these rods take a glass-like polish, which reduces the friction to a minimum. Due to this, the repacking of the pump is reduced by two-thirds. The packing does not harden, which, coupled with the non-corrosiveness of Monel Metal, virtually eliminates scoring. The advantages gained in ordinary service are more apparent where sulphuric acid, salt water and other acid or alkaline conditions are present.

The photograph shows a group of pumps in the works of Worthington Pump & Machinery Corp.; Blake & Knowles plant, comprising horizontal and vertical, single and duplex types for handling water and air, in process of construction. This group represents but few of the large number of pumps now being rapidly pushed to completion, all of which are equipped with piston rods, valve rods or pump cylinder linings, etc., of Monel Metal. As the manufacturer writes us, "*Monel Metal was selected because of its perfect, non-corrosive and acid-resisting properties, together with the great strength and durability of the metal, it having all the virtues of copper without its drawbacks, and the strength of steel without any of its limitations.*"

Where special conditions make it desirable, the entire pump body can be cast of Monel Metal, as in the case of the set of pump castings shown on page 16. These pumps have been in service a number of years handling a combination of sewage, salt water, and acids, and have shown no signs of deterioration in that time, while little or no trouble has been experienced with the packing. The steam end of these pumps is of the usual construction, except that the piston rods are of Monel Metal.

As the result of a number of years' experience, we have accumulated considerable valuable data concerning the use of Monel Metal for pump liners and rods, and will be glad to place this at the service of the prospective user of pumps for acid, alkaline, or other corrosive solutions.

MONEL METAL

Hurricane Rotary-Dyeing and Bleaching Machine of
Monel Metal Complete

Typical Monel Metal Spiders for Dyeing Machines

THE BAYONNE CASTING CO.

MONEL METAL

Dyeing Machinery

DUE to the necessity of handling acid or strongly alkaline solutions, Monel Metal is very generally employed in manufacturing the parts of bleaching and scouring machinery and dyehouse equipment in general, where contact with these corrosive solutions is necessary. It enters into the construction of skein machines for dyeing wool and cotton: also for bleaching cotton and scouring wools and worsted. Likewise skein machines for dyeing silk, artificial silk or mercerized cotton, as well as for garment dyeing and bleaching machines for hosiery, underwear, etc.

In some of the above machines, Monel Metal is used only for the propeller shafts and propellers employed to agitate the solutions, while in others it is employed for the tank as well, so that the entire machine outside of the operating gears, belt pulleys and the like is manufactured of Monel Metal. This is true of the machine illustrated, about which the makers state: "We find that a machine built this way is suitable for practically all kinds of dyeing and bleaching and has the special advantage that it can be cleaned in a few minutes with water."

Some of the solutions which Monel Metal has to withstand in this industry are as follows:—

For dyeing wool and worsted yarn, etc.: Solution glauher salts 20%, bisulphate soda 10%, sulphuric acid 4%, at boiling temperature. Also acetic and oxalic acids in connection with sulphuric in the proportion of 6% to the weight of the material.

Chrome colors. Sulphuric acid 5%, bichromate potash 5% at boiling temperature in conjunction with the dye-stuff required.

Manufacturers of dyeing machinery state further:

"We have found Monel Metal resists the action of these chemicals where bronzes do not."

"Monel Metal is superior to any other available metal for peroxide bleaching in that it forms no discoloring sediment when put to this use and has no adverse effect on the bath or the goods being bleached, *a statement that cannot be made of any other metal.* This makes it particularly valuable where one and the same machine may be used for peroxide bleaching as well as dyeing."

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal Crates, Pickling Pins, Tie Rods for Pickling Tanks, etc., used with Pickling Machines

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal for Pickling

DUE to its greatly superior resistance to corrosion, Monel Metal has been found much more advantageous for use in pickling than bronze or any of the other acid-resisting materials. It is largely employed for pickling tank fittings, tie rods, bolts, washers, crates, pins, and other metal parts which are immersed directly in the acid solution.

As experience is the best guide in matters of this kind, the prospective user can form his own opinion of its merits from the following letters:

"We have used Monel Metal rods for tying together wooden pickling vats for several years. These rods have proven very satisfactory and far superior to the acid-resisting bronze rods which we used prior to that time. In pickling sheet steel we use 60% sulphuric acid diluted to about 7% solution, at 180° to 200° F.

THE YOUNGSTOWN IRON & STEEL COMPANY,
C. B. CUSHWA, *Gen. Supt.*"

"We have used Monel Metal rods in the pickling of steel bars and sheets, and are very well pleased with them inasmuch as the life of the Monel Metal rods is much greater than that of anti-acid Metal which we used heretofore.

These rods resist the acid much longer than any other material we have ever used, and in addition to this they are much stronger, which is quite an item in drawing our tubs together and keeping them tight to prevent leakage. The pickling solution is 60% Sulphuric Acid to extent of 10%, the bath being kept at boiling temperature.

ALLEGHENY STEEL COMPANY,
Pittsburgh, Pa."

"We have used Monel Metal pickle pins that are exposed to 10% sulphuric acid up to 175° Fahrenheit for two years without appreciable loss. These pins are always washed with water after they leave the acid.

Monel Metal castings, such as rub plates, plugs and sockets, do not give as good service, but are better than any bronze we have ever been able to obtain. The principal reason for their failure is the fact that they are not washed off after immersion in acid, and the action of the acid and air will in time destroy them.

THE AMERICAN ROLLING MILL COMPANY,
Middletown, Ohio."

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal Golf Club Heads are cast in all of the popular models.

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal Golf Heads

GOLF CLUB HEADS that will not rust have been sought for years by every enthusiastic devotee of the sport, but such an ideal was not attainable until the advent of *Monel Metal*. Possessing all the qualifications of steel for this purpose with some characteristics that are superior, Monel Metal Heads compared with the iron or steel heads are in golf what the self-starting 1918 model is to the one-lunger of ten years ago in motoring.

Endless attempts have been made to produce a non-rusting golf head by using alloys of other metals or by giving steel heads a special treatment, but the softness of these alloys made them of no practical value, while the special treatment given to steel or iron was not lasting.

Every golfer has his own ideal of what his sticks should be. They must be right to a hair in weight, in balance, in lie, in breadth and length of head and other characteristics that make them just the thing for his individual play.

Monel Metal Golf Heads are the product of many years' experience in turning out heads that will exactly meet these distinctive requirements, plus the quality of being absolutely non-corrodible, which makes them the expert golfer's ideal. Every time an ordinary iron or steel head becomes rusty it has to be buffed on an emery wheel. This cuts away more of the metal every time it is done, thus lightening the head and destroying the fine balance of the club.

A little soap and water or rubbing with wet sand will restore a Monel Metal Golf Head to its normal finish, which is the dull polish of a razor or the appearance of a nickel piece after some use. No amount of wear or cleaning will alter the finish or balance of the head. If desired, Monel Metal Heads may be given a high polish which will be found much more lasting than on other metals.

In addition to having a tensile strength and hardness close to that of steel, a Monel Metal Golf Head has the further advantage of being more resilient. The ball leaves the club clean and with the right "feel."

Monel Metal when cast has the properties of forged steel; therefore, it is possible for us to duplicate any head with ease and enables us to copy from the best models of the leading Scotch cleekmakers without variation.

THE BAYONNE CASTING CO.

MONEL METAL

Monel Metal Rods

MONEL Metal Rods are carefully rolled under expert supervision in a modern mill. The process is practically that used in the rolling of steel. The ingots used are cast with large sink heads to insure sound metal, and before rolling they are chipped all over with pneumatic hammers to remove all superficial defects. Ample allowance is made in the reduction of the ingot to the rod, so that the crystalline cast structure of the metal is most thoroughly broken up and a fine-grain uniform product obtained at the finish.

The ingot is first heated to a proper temperature in a heating furnace, and then broken down or cogged to a billet of the proper size for the work at hand. This billet when cold is inspected carefully for cracks or flaws, which, if found, are chipped out with pneumatic hammers. Only sound billets are allowed to continue in the process. After inspection and preparation the cogged billet is again heated to the rolling or forging temperature and finished to the proper size and shape, according to the same procedure that is used in producing steel rods. In this operation attention is given to using a billet of sufficient cross sectional area to allow a thorough reworking of the material.

The rods are very close to shape and size, having an excellent surface, and practically the same tolerance applies to Monel Metal Rods that is in force on hot rolled steel.

We are able to supply these rods in round, half oval, square, rectangular and hexagonal shapes. Heavy rods, such as those over $3\frac{1}{2}$ " diameter, are usually hammered (forged) instead of rolled.

Besides the stock sizes of rounds, squares, and hexagons, a number of sizes of rectangles are also carried, and other sizes of rectangles can be obtained promptly from the mill. Round and square rods larger than the stock size specified can also be obtained promptly, and the mill facilities are such that large hammered rods can be obtained in any reasonable commercial size.

The applications of Monel Metal rods, as in the other products, are many and varied. We might mention a few of the most important, *i. e.*, Pump Rods, for which service Monel Metal is unequalled by any of the better bronzes. Every manufacturer should try at least one of these rods and become convinced of the economy of using Monel Metal throughout his plant for this service. Turbine blading and valve stems for power plants, both marine and stationary, demand a large tonnage of Monel Metal rods annually. Tie rods and pickle pins for steel mills, together with the various chemical industries also consume considerable quantities.

MONEL METAL

Monel Metal Sheets

THE practice now followed in rolling Monel Metal sheets is the culmination of nine years' experience plus a great deal of experimental work. In the course of this work trials were made with various shapes and sizes of ingots; methods of heating were investigated, special furnaces built and tested, and the problem of annealing and cleaning was very thoroughly studied. As a result, the established practice represents the best thought and endeavor, not only of the producers of Monel Metal, but that of a large number of other sheet specialists who contributed their advice and assistance.

The ingots used are 11"x11"x60" weighing about 1,850 lbs. each. These ingots are carefully chipped to remove surface defects, heated in soaking pits and rolled to sheet bars on a three-high bar mill. The resulting sheet bars are cut to length and cross rolled to sheets, using a heating furnace designed especially for the heating of Monel Metal. These sheets are squared in guillotine shears and box annealed, using natural gas to remove the oxide formed in the hot rolling. The soft sheets are then cold rolled to insure uniformity of thickness and trueness to gauge. Following this, they are reannealed in boxes with charcoal to insure the complete removal of all oxide. Finally they are either roller, or patent, levelled and re-sheared to exact size, the light gauge sheets being crated and the heavier sheets bundled before shipment. By this method Monel Metal sheets are produced uniform in gauge and texture with soft, thoroughly deoxidized surfaces which can be readily formed, stamped, spun and soldered.

Hot Rolled Monel Metal sheets can be obtained in practically the same sizes and gauges as Hot Rolled Sheet Steel.

The following are the stock sizes:

Hot-rolled sheets from No. 8 to No. 26, measure 36"x96".

Hot-rolled sheets from No. 4 to No. 7, measure 36"x84".

Hot-rolled sheets from No. 3 gauge, measure 36"x76".

Cold-rolled strips, maximum width 12", from .010 to .250" thick. Lighter gauges can be made in narrower widths.

For the production of cold-rolled sheets, sheet bars are used, produced as described above. These are first planed or milled to remove all defects, and insure an unblemished surface on the finished sheets. After milling, the bars are rolled cold on highly finished rolls to the proper size and gauge. These sheets are generally furnished soft-annealed but they can be supplied hard, or in any intermediate temper desired.

MONEL METAL

Wire Products

IN the manufacture of low-temperature heating devices such as car-heaters, as well as of high precision electrical instruments, Monel Metal, owing to its good electrical properties, has proved very satisfactory. Monel Metal has a resistance of 256 ohms per mil. ft. and a temperature coefficient of .0011 per degree F. Its practically nil temperature coefficient is an important feature when Monel Metal is used for electrical purposes.

Manufacturers of spark plugs have been using Monel Metal for electrodes for many years. When used in the heavier sizes it stands up under severe service, giving entire satisfaction. Practically all of the carburetors now manufactured in this country are furnished with needle valves of Monel Metal on account of its non-corrosive character. Wire rope in the form of tiller rope and sash cord has also been manufactured from Monel Metal for many years and is used in many places where great strength must be combined with non-corrodibility. In the manufacture of fountain-pens there are many valuable uses for Monel Metal, owing to the corroding influences of various kinds of ink. This also is true in the case of fishing-tackle which comes in contact with corrosive elements, such as salt water.

It is not possible to give a detailed description of the large number of applications of Monel Metal in this field but we would be glad to place at your disposal all data covering applications similar to your problems. Some of the numerous other applications of Monel Metal wire and rod products are: aeroplane parts, tie rods, snap fasteners, tacks, rivets, machine screw products, bolts, nuts, screws, escutcheons, buckles, parts for plumbing equipment, lock parts, eye-glass and spectacle mountings, surgical instruments, wood screws and washers, chains, metal trimming for office furniture, trunks, cameras and other similar articles.

As Monel Metal can be readily soldered with killed acid, brazes easily and can be welded either electrically or by the oxy-acetylene torch, it is equally adaptable to composite as well as to one-piece construction in any of the fields mentioned. Owing to its ductility it can be used for practically all products of the screw machine. It can also be furnished in a hard temper suitable for making low tension springs. While it is not essentially a spring material it has been used for this purpose in certain places where a non-corrosive metal is desired.

Monel Metal can be furnished in the form of wire or rod or rolled in the form of ribbon and can be supplied in coils, on spools, or cut to specified lengths.

MONEL METAL

Tools for Turning Monel Metal

1. Roughing Tool

2. Threading Tool

The border is only part of a typical turning from a Monel Metal Rod. The original was over 25 feet long.

THE BAYONNE CASTING CO.

MONEL METAL

Working Monel Metal

Machining Monel Metal

MONEL METAL machines with a long, tough chip, as will be noted on the opposite page, in this respect resembling copper, but requiring more power to cut.

Experiments made in our own laboratory indicate that rolled or drawn Monel Metal and mild steel require about the same power to machine. Cast Monel metal requires somewhat more power.

Owing to the great toughness of the metal, tools with a keen edge are necessary in all machine work. These tools should be ground with a decided rake or lip, and only the better grades of high speed steel used.

We have had recommended to us, by concerns using Monel Metal, several high speed steels that have given satisfaction—to wit—Poldi (OOOX-Extra), Rex A, Rex AA and Red Cut Superior. Stellite, a non-ferrous alloy, has also been recommended.

Directions for treating tools are furnished by the manufacturers and are followed to advantage. Angles to which tools should be ground are shown on opposite page.

Lubricants and cooling solutions are used by some, while others prefer to cut dry. For ordinary machine work Monel Metal may be cut dry very satisfactorily. Some of the lubricants that have given satisfaction are as follows:

- (1) Lard Oil and 10% turpentine (fine boring).
- (2) Machine Oil (general).
- (3) Mineral Lard Oil, plus 300 test burning oil (threading).
- (4) Lard Oil—Borax and Aquadag (cutting off).
- (5) Exanol (general).
- (6) Oakite (milling).

Cutting speeds vary greatly from a slow speed of 8 ft. per minute with heavy cut and feed, to a high speed of 250 ft. per minute with light cut and feed. In the latter case a Stellite tool was used with machine oil for lubricant. A good average speed for general work would be from 50 to 60 ft. per minute with $\frac{1}{8}$ " cut and $\frac{1}{32}$ " feed.

Where a smooth, bright, finishing is desired, a higher speed with light cut should be used, always remembering that the tool must be kept sharp.

MONEL METAL

Annealing

MONEL Metal rods are annealed by heating to any temperature between 800 and 1000 degrees centigrade, and the rods are progressively softened by increased temperatures between these two points. Heating above 1000 degrees centigrade does not give any additional softness.

Monel Metal sheets are annealed by heating to any temperature above 875 degrees centigrade. The degree of softness obtained is dependent upon the amount they are heated above this temperature.

Monel Metal castings are used as cast, without annealing.

In annealing Monel Metal the speed of heating and cooling is relatively unimportant, but it is essential that the material be held at the annealing temperature for a sufficient time to allow it to become heated through. Since the heat conductivity is low, this will take a considerably longer time than in the case of copper, brass or steel. It is recommended that Monel Metal be annealed wherever practicable buried in charcoal in tight boxes, so as to prevent the formation of oxide and it is possible to remove oxide already formed by this reducing anneal.

Pickling

PICKLING of Monel Metal is, at the best, an expensive and tedious operation, and it is advisable to anneal in charcoal wherever possible, so as to keep the metal from becoming covered with oxide. Where this cannot be done, pickling may be done as follows:

Make a 12-degree Beaumé solution of ferric sulphate in water. A large excess of ferric sulphate does little harm to the metal and greatly decreases the time of pickling, but tends to increase pickle consumption. Sufficient ferric sulphate should be kept in the solution at all times to prevent any deposits of copper. This solution works best at 100 to 140 degrees F.

Where the oxide is not too heavy, pickling can also be done with a hydrochloric acid solution of 1.1 specific gravity at boiling temperature.

THE BAYONNE CASTING CO.

MONEL METAL

In pickling Monel Metal, it should be kept strongly in mind that the scale is a mixed oxide of copper and nickel so that its solution puts copper in the bath, and also that Monel Metal has the property of cementing copper just as iron does. This cementation or "coppering" is prevented by the method described, but care should be taken to keep all iron pins and bars from any continued contact with the Monel Metal, and no iron band, wires or fasteners should be used.

During pickling, part of the scale is dissolved and the rest remains adhering to the metal so that the progress of the pickling should be observed by removing a piece of metal from the bath and washing with a jet of water or rubbing with a piece of waste. When the scale becomes loose so that it may be easily rubbed off, remove the metal and wash it with a jet of water or scrub with a brush to remove all adhering scale.

Forging

IN forging Monel Metal experience has shown that the following details should be observed:

1st. The best forging temperature lies between 900 and 1100 degrees centigrade, and care should be taken not to exceed the latter temperature.

2nd. In heating Monel Metal a low sulphur fuel is necessary, preferably oil or gas, and care should be taken not to have the flame conditions either strongly oxidizing, or strongly reducing.

3rd. Care should be taken to have the metal heated uniformly, which is best accomplished by repeatedly turning the ingot while in the furnace.

4th. The heat should be carried well past the point of work.

5th. If a forging of high strength is required, finish the forging at a temperature of 500-600° centigrade.

THE BAYONNE CASTING CO.

MONEL METAL

Polishing and Finishing Monel Metal

To manufacturers of novelties, plumbing fixtures, automobile trim, etc., it will be of interest to know that Monel Metal when polished and buffed takes the same finish and can hardly be distinguished from pure nickel; in fact, the color of Monel Metal is a trifle more attractive. For these purposes there is now being furnished considerable Monel Metal in its various forms.

In finishing Monel Metal, the instructions noted below will be found valuable.

Castings

In polishing castings it is necessary:

- 1st—Use a solid stone, of which there are several grades and makes. We have found Norton Company's Grade "Q," Grain No. 20; also Carborundum Company's Grade "G," Grain No. 16, very satisfactory.
- 2nd—A rag, wood, or canvas wheel coated with No. 40 emery.
- 3rd—A rag, wood, or canvas wheel coated with No. 120 emery.
- 4th—A rag, wood, or canvas wheel coated with No. 120 emery and finished with an ordinary buff, using buffing compound.

Hot Rolled Rods

In polishing rods it is necessary:

- 1st—A rag, wood, or canvas wheel coated with No. 90 emery.
- 2nd—A rag, wood, or canvas wheel coated with No. 120 emery.
- 3rd—A rag, wood, or canvas wheel coated with No. 120 emery and finished with an ordinary buff, using buffing compound.

Sheets

In polishing sheets it is necessary:

- 1st—A rag, wood, or canvas wheel coated with No. 90 emery.
- 2nd—A rag, wood, or canvas wheel coated with No. 150 emery.
- 3rd—A rag, wood, or canvas wheel coated with No. 150 emery and finished with an ordinary buff, using buffing compound.

MONEL METAL

Manufactured Forms

RODS—rounds, squares, hexagons, rectangles, half ovals.

CASTINGS—from consumer's patterns.

FORGINGS.

WIRE—annealed and hard.

WIRE CLOTH.

WIRE ROPE.

BALL BEARINGS.

STRIP STOCK.

TUBES.

SHEETS.

BOLTS and NUTS.

LAG SCREWS.

SCREWS—wood and machine.

SCREW MACHINE PRODUCTS.

TIE RODS.

WASHERS.

NAILS AND RIVETS.

CHAIN.

GOLF CLUB HEADS.

All these forms are not manufactured by us, but we will be glad to refer you to the makers upon inquiry.

THE BAYONNE CASTING CO.

MONEL METAL

Some Uses for which Monel Metal has Proved Superior

Power Plants

(High Pressure Superheated Steam)

- *† Valve trim (seats, discs, stems) for superheated and high pressure steam.
- † Turbine blading and shrouding, also various parts that come in contact with the steam.
- *† Valves and valve trim.
- *† Pump liners.
- † Pump rods.

Marine Installations

(Salt Water)

- *† Pump liners.
- † Pump rods.
- * Propellers (small and large, from small launches to battleships).
- †* Propeller shafts and boat trim, such as deck fittings, stern bushings, rudders, struts, stuffing boxes, shaft sleeves, etc.
- †† Marine Condenser parts, such as tubes, ferrules, etc.

Gas and Oil Engines

(Extremely High Temperature)

- † Valves for combustion engines (exhaust).
- * Ignition chambers for oil engines.
- w Wire—engine ignition, needle valves on carburetors, cables, wire cloth, electrical purposes.

Pickling and Chemical Works

(Acid Solutions at Various Temperatures)

- †* Tie rods—nuts and washers on vats for Tanners, Platers, Chemical Works, etc.
- † Bolts and nuts and lag screws (in condensers for Oil and Chemical trade).
- †* Pickling crates and frames for Rolling Mills.
- † Pickling Pins for Rolling Mills.
- † Tie Rods—Pickling Tanks for Rolling Mills.
- ††* Pump liners and rods.
- *† Valves and valve trim for use with chemicals.

Dyehouse Equipment

(Acid and Alkaline Solutions)

- ††* Dyeing and bleaching machinery—parts that come in contact with chemicals.
- *†† Drying machines.
- *† Pump liners.
- † Pump rods.
- * Castings
- † Rods w Wire
- † Sheets or Strips.

THE BAYONNE CASTING CO.

M O N E L M E T A L

Mining Equipment

(Alkaline Water, Etc.)

- †*† Mining machinery and equipment, mine screens, coal chutes, etc.
- †* Pump liners.
- † Pump rods.

Automobiles

(Exposure to Weather)

- † Ball bearings.
- †* Auto fittings and parts—brake release lever grips, handles, etc.

Dairy Equipment

(To Insure Easy Sterilizing)

- ††*w Dairy machinery—butter handling machines, milking machines, separators and pasteurizers, etc.

Packing Houses

(Salt Water)

- ††*w Equipment in general, of Packing Houses that comes in contact with brine and salt.
- †* Pump liners and rods.

Miscellaneous Uses

- † Storage battery casings
- † Meat slicing and grinding machines.
- * Golf club heads.
- †* Parts of submarine torpedoes and ordnance.
- † Valve stems for high-pressure fire service.
- * Handles for knotters used in the Textile trades.
- ††*w Machinery and equipment for use in the tropics.
- † Fountain pen parts.
- †*† Ink handling machines—bottle fillers, etc.
- *† Ornamental trim on Public Buildings.
- *† Mechanical conveyors and containers in furnaces for tempering and forging.
- *† Parts of equipment in Glass Factories that come in contact with hot glass.
- *† Incinerator and sewage handling machinery.
- w Wire netting and screens.
- † Burning points and racks for enamel ware makers.
- * Still plugs and parts for Burton stills (used in the production of gasolene).
- † Skylight frames and flashings for train sheds.
- ††† Laundry machine parts.
- ††† Refrigerating machinery and refrigerators.
- †† Knives, forks and spoons, novelties, etc.
- †† Bank vault and safe trim handles, wheels, etc.
- *† Artificial limbs.

Any information we may have on file regarding the above uses may be had on inquiry
